

Whats is Kidney Stone?

Kidney stone or kidney stones- is a kidney or urethral disease in which small or big stones are formed inside the kidney. Mankind has been afflicted by urinary stones since centuries dating back to 4000 B.C.This condition is usually found in people aged between 30 and 60 and is four times more likely to occur in men than women. 1 in every 10 Indian family will have someone suffering from this painful condition.

Types of Kidney Stones

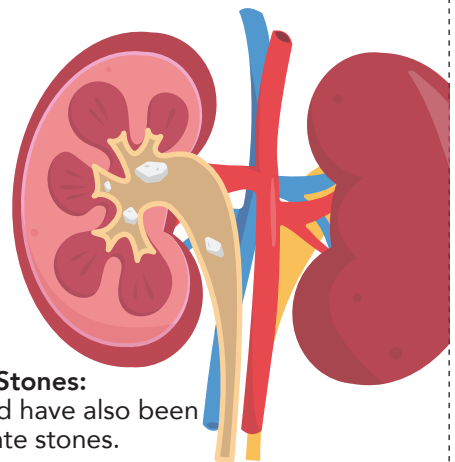

Calcium Stones: Calcium stones are predominant renal stones comprising about 80% of all urinary calculi.

Cystine Stones: These stones comprise less than 2% of all stone types. It is a genetic disorder of the transport of an amino acid and cystine.

Uric Acid Stones or Urate: This accounts approximately for 3-10% of all stone types.

Drug-Induced Stones This accounts for about 1% of all stone types.

Struvite or Magnesium Ammonium Phosphate Stones: Struvite stones occur to the extent of 10-15% and have also been referred to as infection stones and triple phosphate stones.
